

What went well: The group was able to set up their BDD testing properly. While there were some difficulties getting it to work on everybody's machines, likely because of missing API keys and user secrets, it looks like everybody has become familiar with Reqnroll. After talking with Chris, we decided that we'll begin making an effort to get everybody's tests working on everybody's devices.

What went wrong: The group struggled to keep everyone updated on the JIRA board. It was pointed out that we hadn't started our sprint until Chris mentioned it in our mid-sprint technical meeting. Some members forgot to populate the board with their stories for the sprint and everybody forgot to formally assign their stories on JIRA. After some thinking, we came to the conclusion that this was likely because the group had only recently come back from Spring break and were still getting back into the swing of things. Going forward, we hope to fix these issues and quickly readjust to working together as a team in keeping each other accountable and updated.
